

Statistical Texture Classification Using Variants of Local Binary Pattern

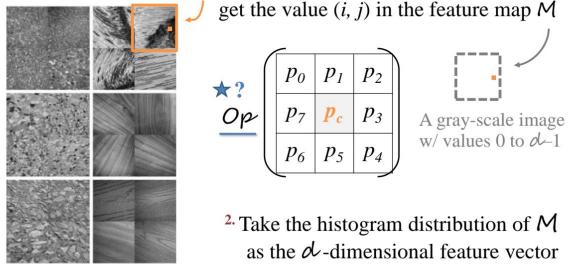

Shixuan Li

Department of Computer Science, University of Toronto

Overview

Texture image \rightarrow Feature extraction \rightarrow 1-NN Classifier

- For each pixel (i, j) in I , apply an operator to its 3×3 patch p to get the value (i, j) in the feature map M

Attractive-Repulsive Strength-Based LBP (ARSBLBP)

A rotation-invariant and space-efficient method:

- Measure strength in the neighbourhood $\rightarrow \{0, \dots, 7\}$

$$As(i,j) = \max(0, \sum_{k=0}^7 \mathbb{1}[p_k \geq p_c] - 1)$$

$$Rs(i,j) = \max(0, \sum_{k=0}^7 \mathbb{1}[p_k \leq p_c] - 1)$$

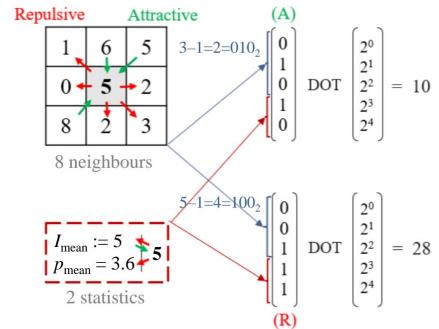

- Add weighted comparisons to statistics $\rightarrow \{0, \dots, 31\}$

$$ASBLBP_{(i,j)} = As(i,j) + \left[\begin{array}{l} \mathbb{1}[I_{\text{mean}} \geq p_c] \\ \mathbb{1}[p_{\text{mean}} \geq p_c] \end{array} \right] \cdot \begin{bmatrix} 2^3 \\ 2^4 \end{bmatrix}$$

$$RSBLBP_{(i,j)} = Rs(i,j) + \left[\begin{array}{l} \mathbb{1}[I_{\text{mean}} \leq p_c] \\ \mathbb{1}[p_{\text{mean}} \leq p_c] \end{array} \right] \cdot \begin{bmatrix} 2^3 \\ 2^4 \end{bmatrix}$$

- Concatenate the histograms of two M 's $\rightarrow d = 64$

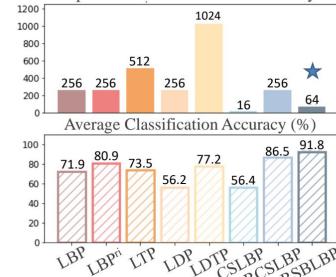

$$\text{hist}_{\text{ARSBLBP}}^{64} = [\text{hist}_{\text{ASBLBP}}^{32} \text{ hist}_{\text{RSBLBP}}^{32}]$$
